Problem  - Kitchens over-prepare daily — demand is guessed, not predicted - No visibility into which items waste most (rice? dal? roti?) - Tomorrow's prep relies on gut feel, not data	Solution  - Demand forecasting — predicts meals needed tomorrow - Per-item waste prediction — expected waste (kg) by category - Recommendation engine + what-if simulator	Unique Value Prop.  Know exactly how much to cook. tomorrow — AI that predicts demand, explains waste, and recommends prep quantities.	Unfair Advantage  Kitchen-specific learning loop — predictions improve as each kitchen logs actuals; explainable recommendations tuned to Indian kitchen staples.	Customer Segments  Hostel / mess managers, canteen operators, small restaurants, cloud kitchens
Existing Alternatives  - Paper registers & logbooks - Head cook's experience and gut feel - Spreadsheets of prepared vs served - Generic expiry-reminder apps	Key Metrics  - Kg of waste avoided per week - Prediction error (MAE / RMSE) % reduction in over-preparation - Recommendation adoption rate	High-Level Concept  A weather forecast, but for your kitchen's food waste.	Channels  - Direct outreach to hostel messes & canteens - College demo day & project showcase - Shareable Streamlit demo link - Food-service owner communities	Early Adopters  College hostel mess managers & small restaurant owners who already track daily prep and feel the cost of waste
Cost Structure  - Model training — free Colab tier - Hosting — Streamlit Community Cloud (free) - Data collection effort - People — student team			Revenue Streams  - Freemium SaaS per kitchen / month - Paid waste-audit reports for chains - API access for food-service platforms
